

ENDOSSAGE MULTI-PLATFORM ATTACHMENTS
GreMedix LLC announces Trigger Point Line of Attachments for the
Endossage Pelvic Pain Therapy System and Endossage TP

WELLINGTON, FLORIDA, March 13, 2018 - GreMedix has released a new trigger point/myofascial release line of attachments.

Patients and therapists have expressed an interest in a trigger point option that is not as hard and rigid as some of the products currently available. Furthermore, a trigger point device that can be custom shaped to suit specific needs was also desired.

The trigger point/myofascial release series of attachments are compatible with all Endossage (OPT, IPT, and TP) base units. Available in two stock diameters, the attachments are constructed of a proprietary multilayer soft prosthetic silicone with a semi rigid flexible core so as to maintain the shape desired by the user. The end of each attachment has a silicone encapsulated rigid tip for application of trigger point pressure. This composition is designed to have a more "biologic" feel rather than hard glass or plastic options currently being used. Attachments can be obtained with a low-G vibration in the rigid tip as an additional option.
